

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

THE EIGHTH INTERNATIONAL CONGRESS OF APPLIED CHEMISTRY

THE history of the origin and development of the international congresses of applied chemistry has, fortunately, been the theme of the chairman's address this evening. The living chain which has connected these congresses has been the distinguished scientists who have filled the offices of honorary and acting president and one other—Dr. Strohmer, of Vienna. This has provided sufficient cohesion and has resulted in congresses of steadily increasing importance, although the rules are few and simple and the membership of each congress terminates with the congress itself. The seventh, held in London during June of last year, was the largest in point of attendance. While the hospitality showered upon the delegates by public officials and private friends was exceedingly lavish, the actual scientific work of the congress was very important, as will be seen when the transactions have been published and distributed.

While chemical science is progressing in all directions with extreme rapidity, there is little doubt in my mind that the holding of these congresses as frequently as every three years is unwise. I hope the eighth congress will decide to change the period of holding future congresses so that the interval will be five years. The labor connected with the preparation and holding of the congresses and subsequent editing and production of the volumes of transactions is enormous, and the expense is very considerable for such moderately rewarded men as most chemists unfortunately are. I am glad to say that our German friends
